Problem 2 — Resolving Patch Manager policy and S3 output issues

Two separate Patch Manager problems occurred: first, the private backend could not retrieve a patch payload and then could not read the Quick Setup baseline configuration object; second, scan output was not appearing in the custom S3 destination. These required both identity permissions and endpoint-policy permissions because the backend's S3 traffic used the S3 Gateway Endpoint.

Issue A — Patch payload returned HTTP 403

The supplied report records HTTP 200 from a public web EC2 instance and HTTP 403 from the private backend when testing a patch payload. The S3 Gateway Endpoint policy was updated with an AllowSSMPatchPayloads statement for the listed patch-related object ARNs. The report records that the backend's retest changed to HTTP 200.

Issue B — baseline_overrides.json returned HTTP 403

The AWS-RunPatchBaseline association then failed because the Quick Setup configuration object baseline_overrides.json in aws-quicksetup-patchpolicy-754025990014-yld5i could not be read. The configuration ID was identified as yld5i. A customer-managed policy named AWS-quick-setup-RunPatchBaseline was added with s3:GetObject access scoped to that bucket's objects, attached to CloudShield-Backend-Role and CloudShield-web-EC2-Role. The tag QSConfigId-yld5i = yld5i was also added as documented.

Issue C — scan output missing from cloudshield-patch-manager-logs

A customer-managed IAM policy named CloudShield-PatchLog-S3-Access was created with s3:PutObject scoped to arn:aws:s3:::cloudshield-patch-manager-logs/* and attached to both EC2 roles. The S3 Gateway Endpoint policy was also updated with AllowPatchManagerLogsBucketAccess for the custom bucket and its objects. The report states that instance-specific output prefixes appeared in the destination bucket after the changes.

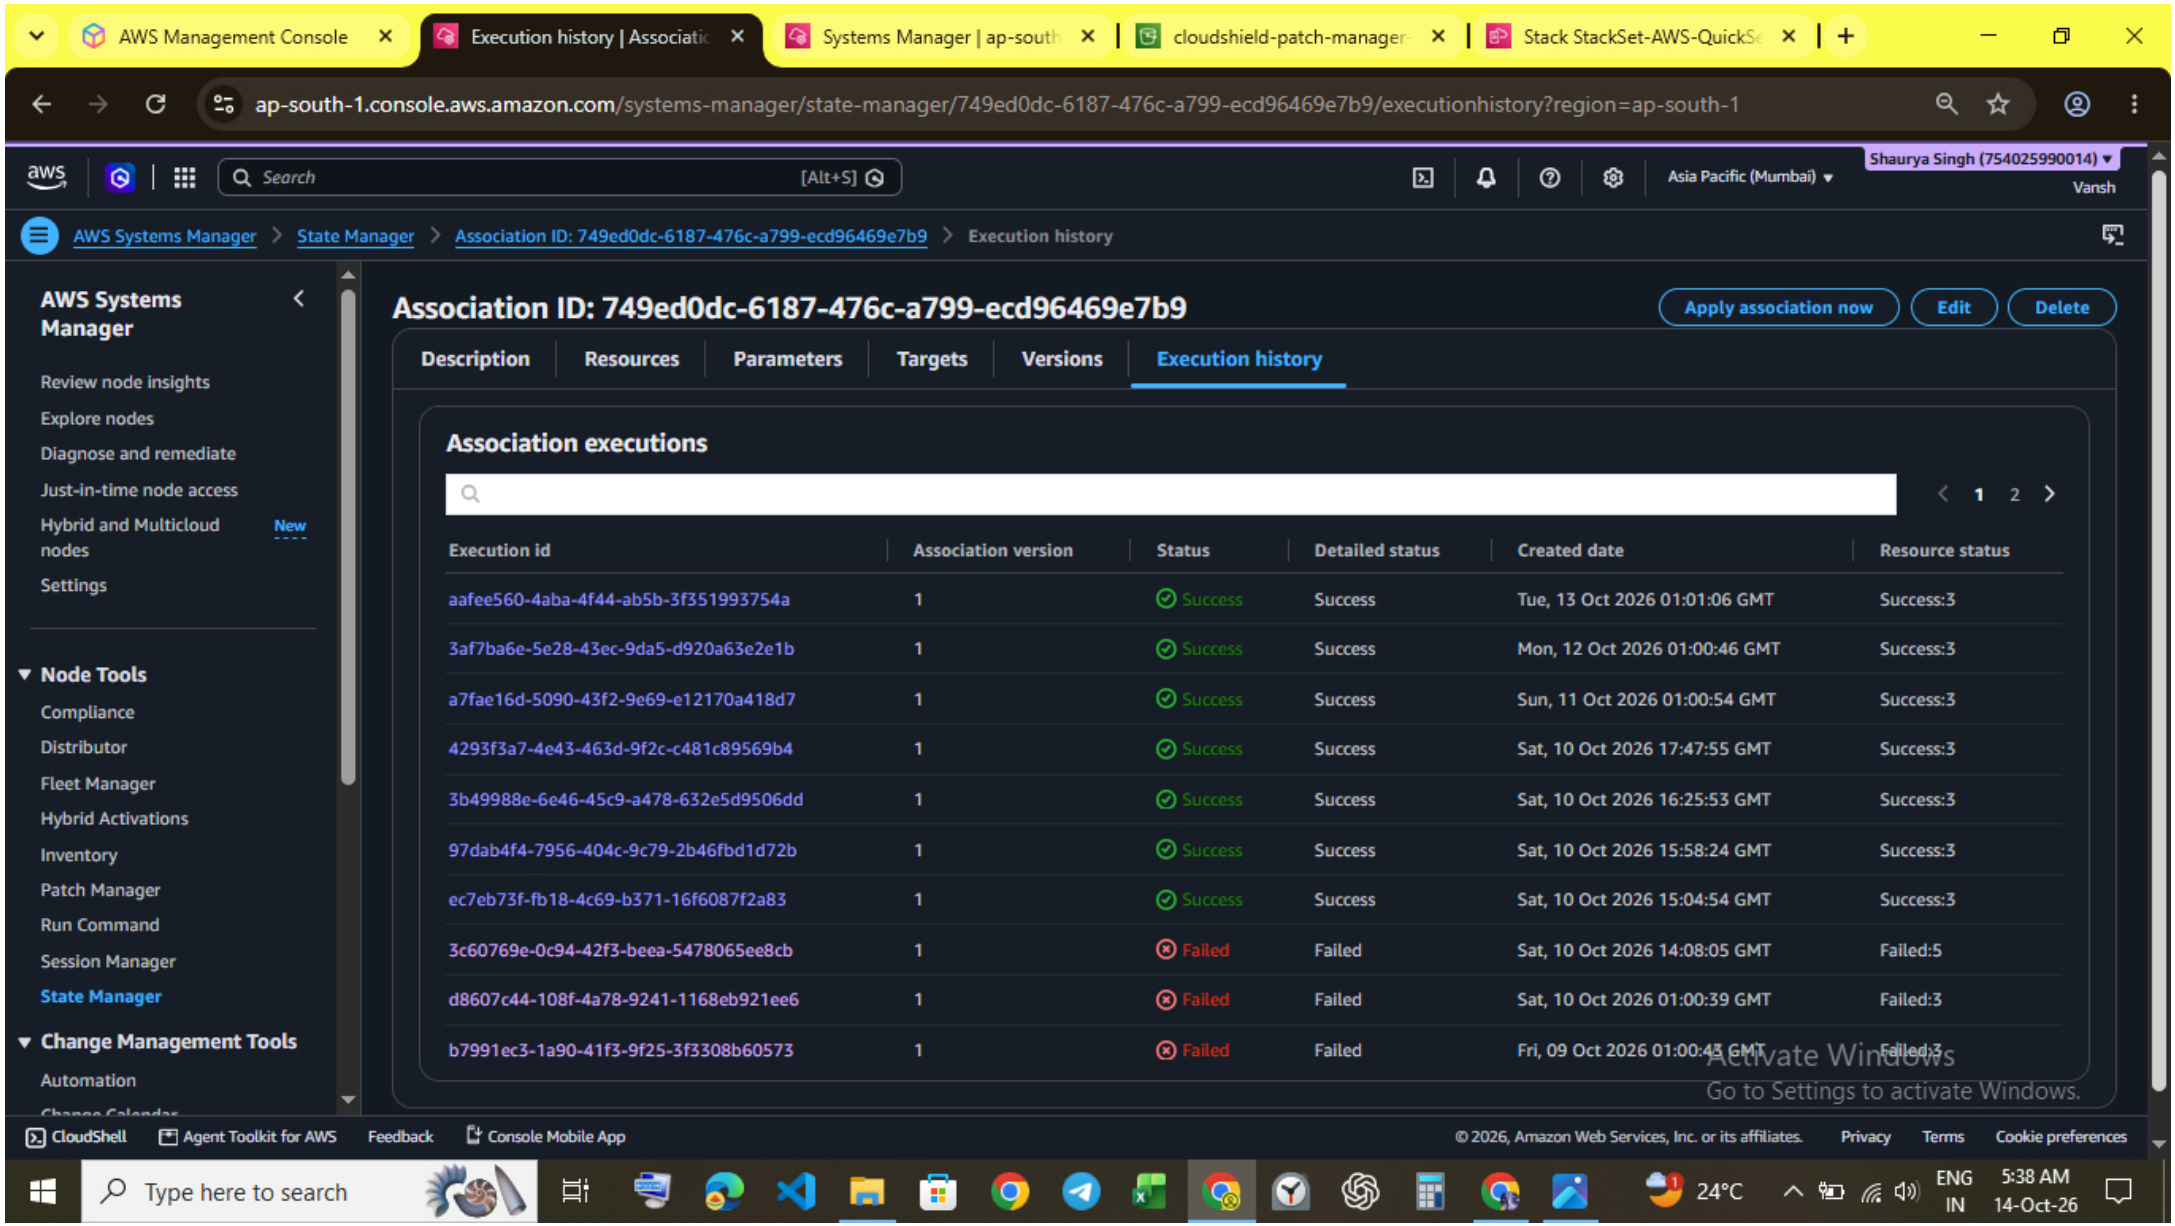

Why the changes worked

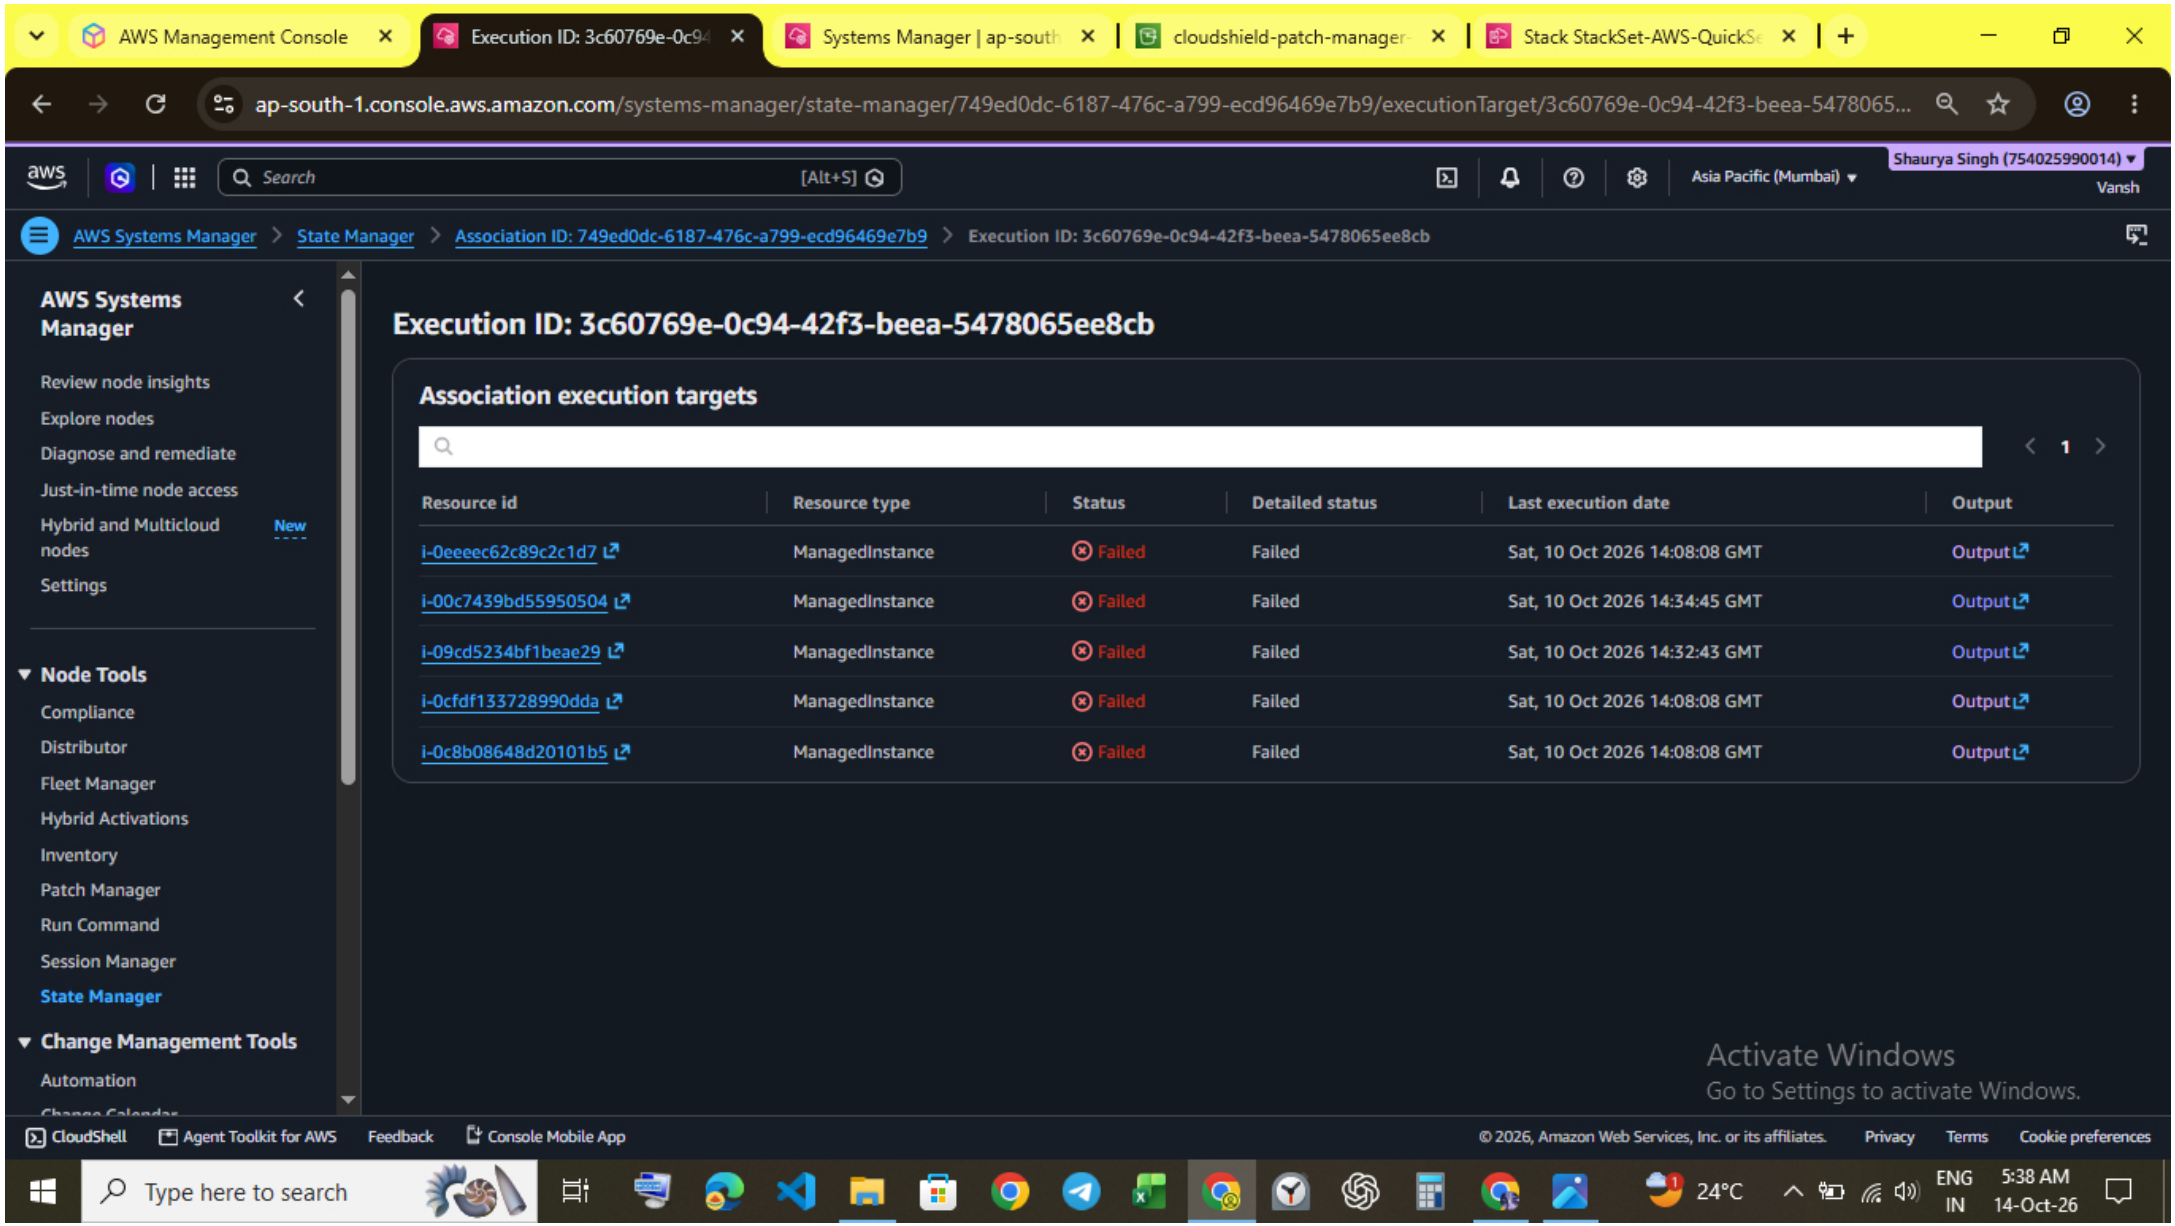

IAM role policies define which actions the instance identity may perform. The S3 Gateway Endpoint policy filters requests passing through the endpoint. Applicable S3 bucket policies and other authorization checks still apply.

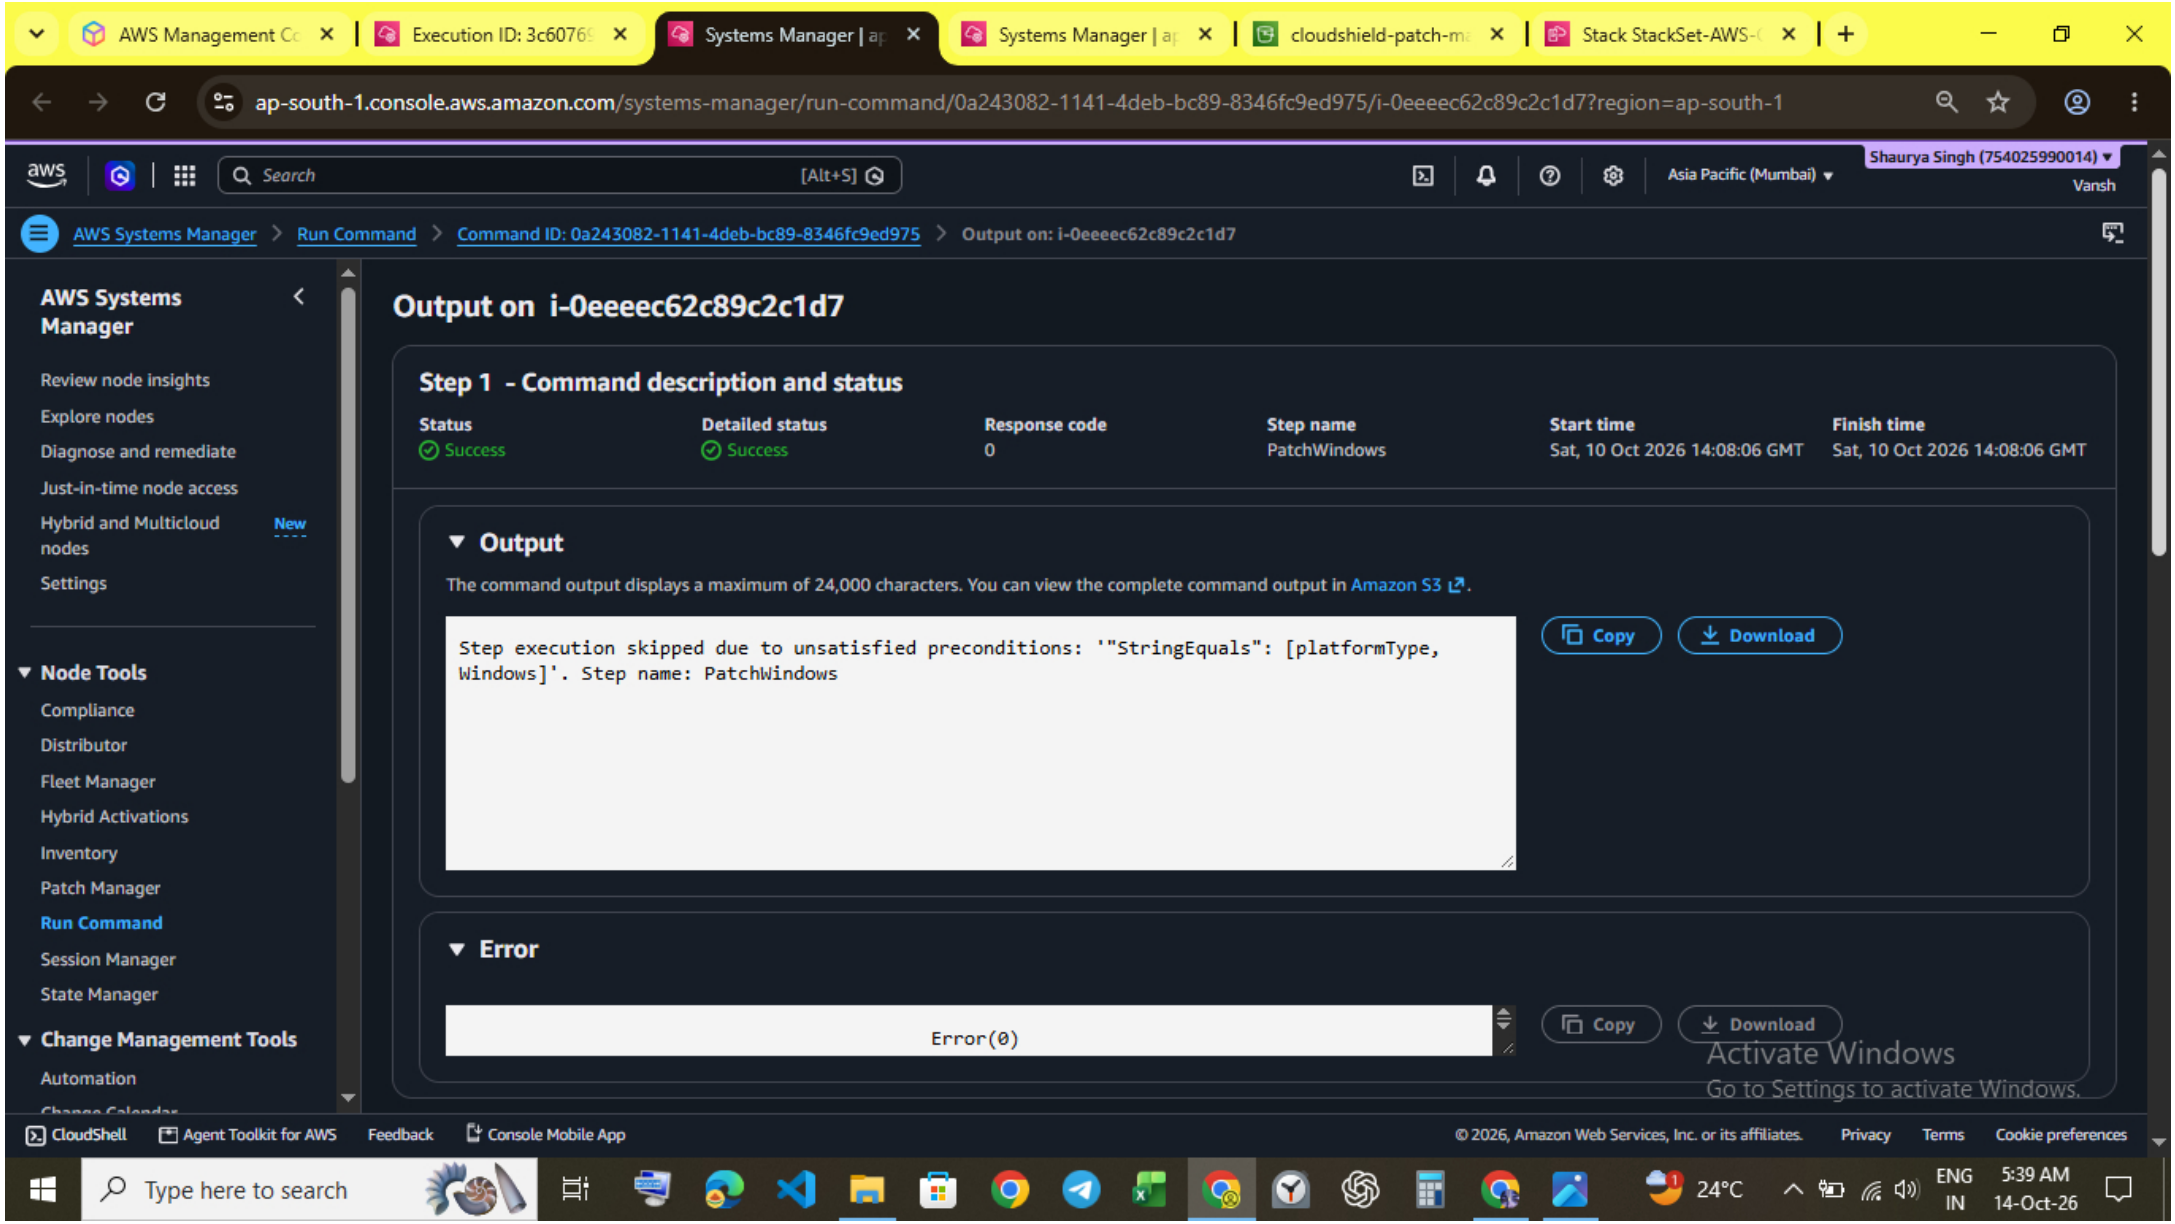

Final verification and scope

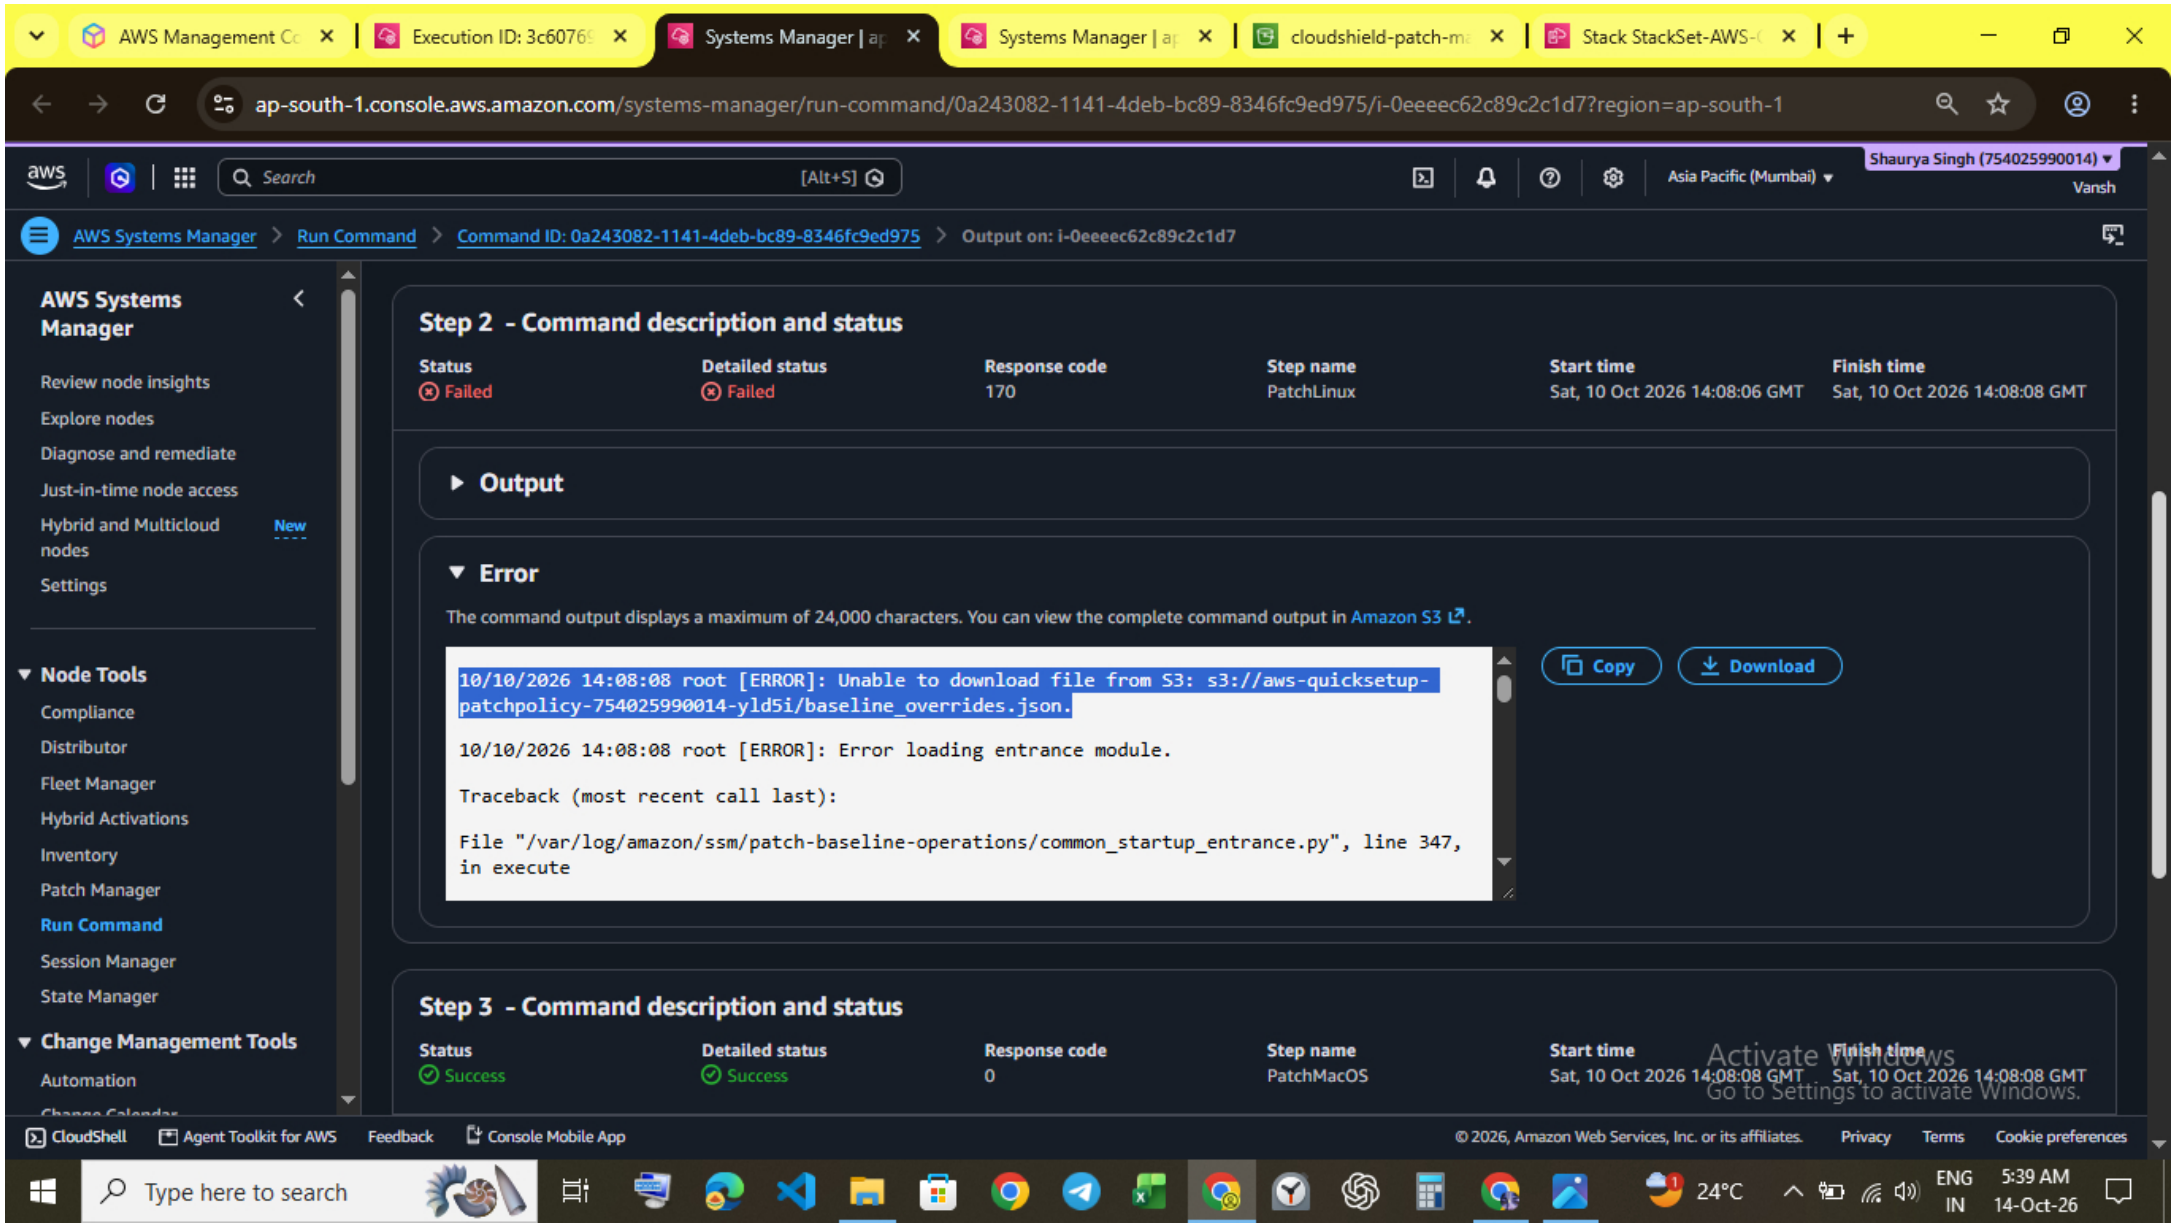

The supplied report records AWS-RunPatchBaseline association status Success for all three targeted resources and output prefixes in the custom S3 bucket. The policy was configured for Scan mode, so this is evidence of a successful scan association, not proof that patches were installed.

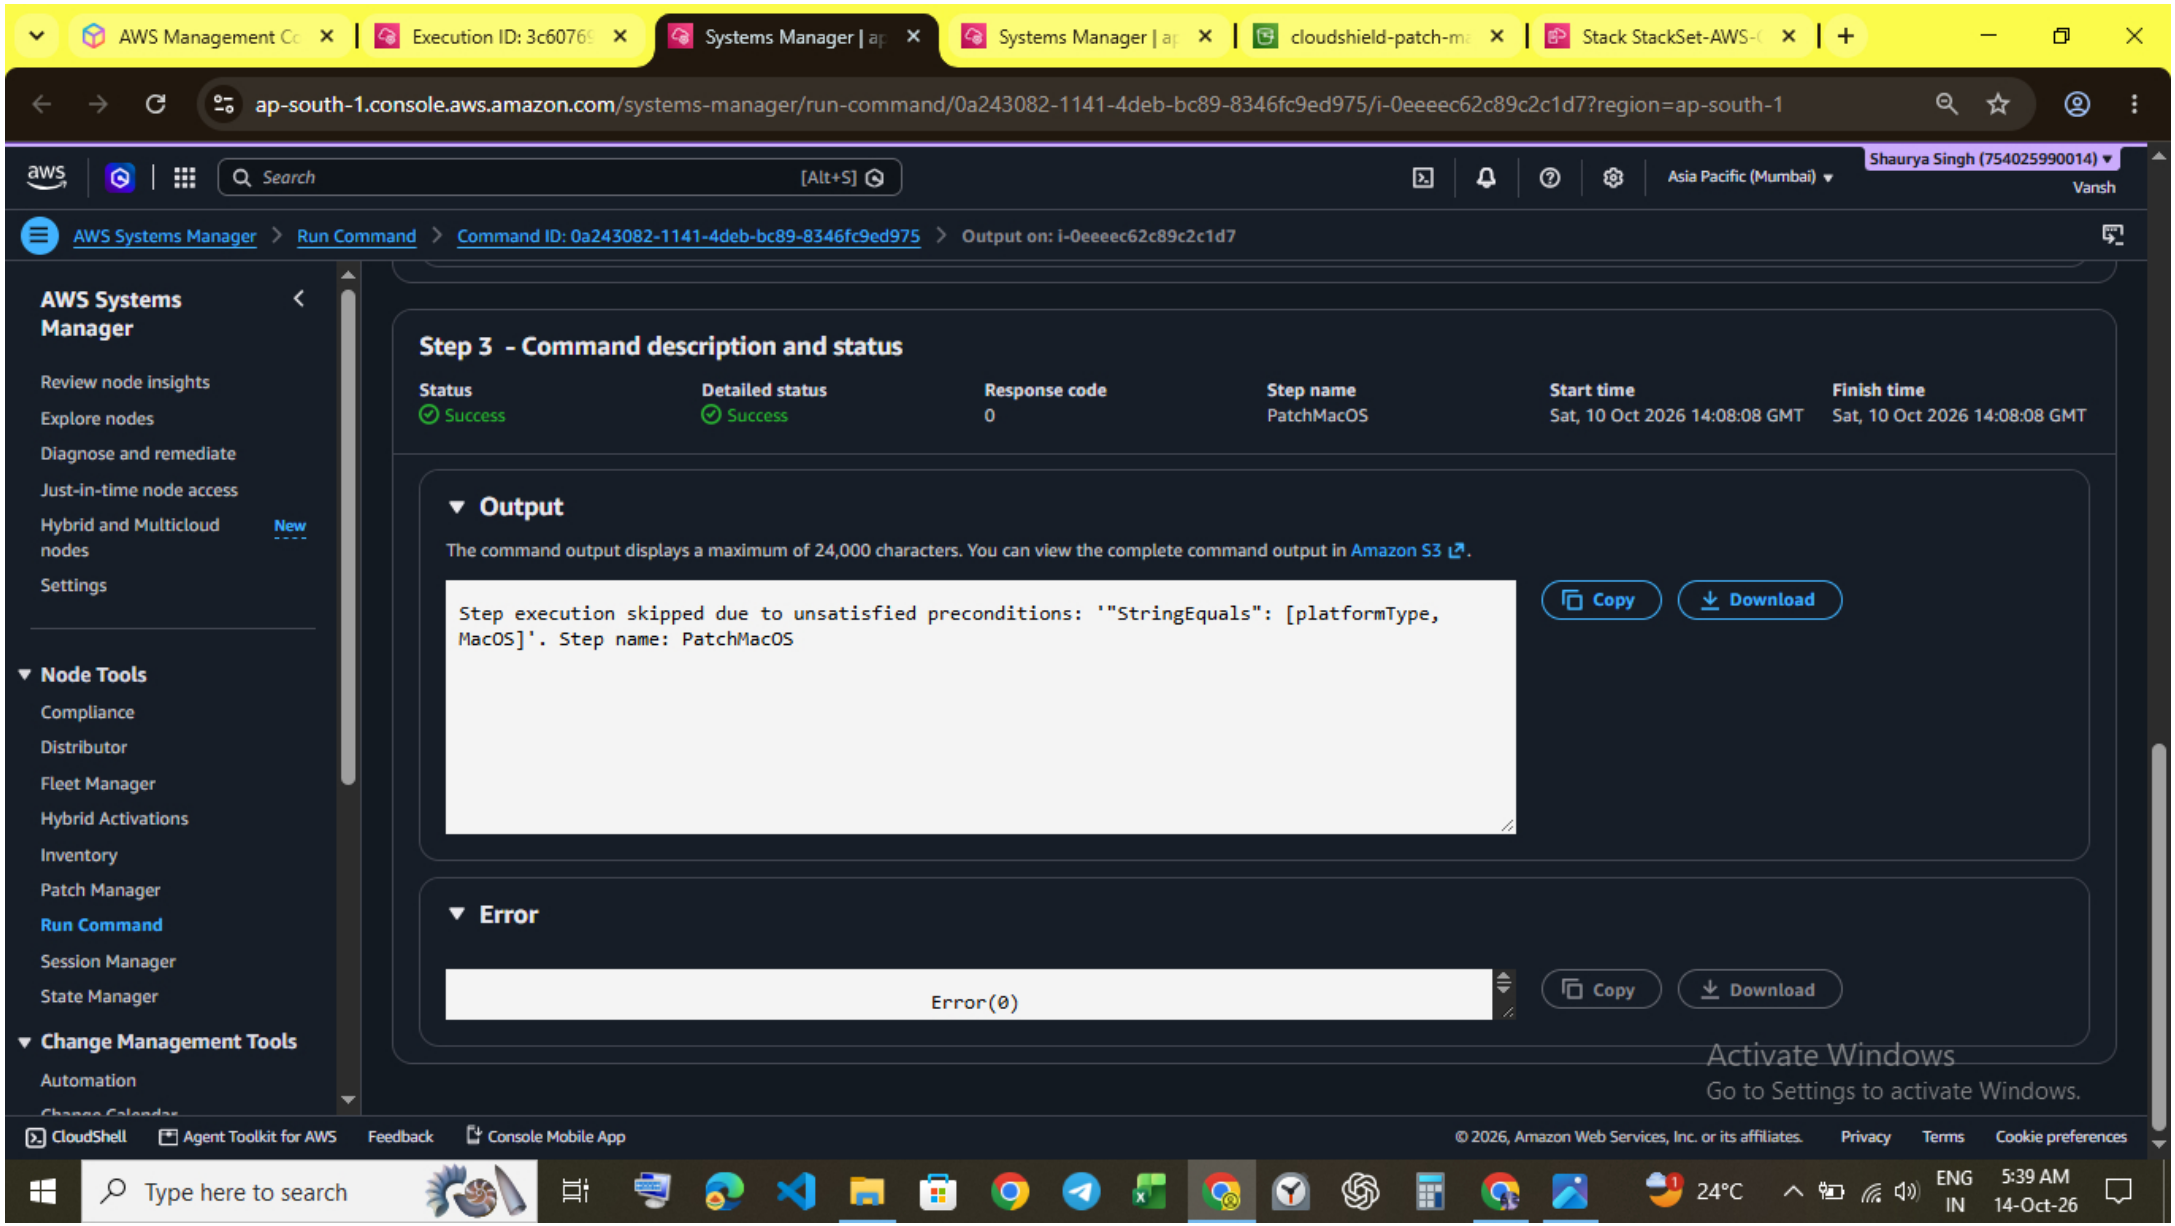

> The original screenshot evidence from CloudShield-Final-PDF, pages 145–195, follows this explanation. The dedicated project-patch-policy-solution.pdf is included at the end as a reference appendix.

aws:runShellScript
Start time
Sat, 10 Oct 2026 13:18:10 GMT
Finish time
Sat, 10 Oct 2026 13:18:11 GMT
Output
The command output displays a maximum of 24,000 characters. You can view the complete command output in either Amazon S3 or CloudWatch Logs, if you specify an S3 bucket or a logs group when you run the command.

Object management overview
The following bucket properties and object management configurations impact the behavior of this object.
Bucket properties
Bucket Versioning
When enabled, multiple variants of an object can be stored in the bucket to easily recover from unintended user actions and application failures.
Enabled
Management configurations
Replication status
When a replication rule is applied to an object the replication status indicates the progress of the operation.
-
View replication rules
Expiration rule
You can use a lifecycle configuration to define expiration rules to schedule the removal of this object after a pre-defined time period.
MoveToGlacierAfter90Days_DeleteAfter10Years
Expiration date
The object will be made noncurrent and generate a delete marker on this date.
October 9, 2036, 05:30:00 (UTC+05:30)

Object Lock
Store objects using a write-once-read-many (WORM) model to help you prevent objects from being deleted or overwritten for a fixed amount of time or indefinitely. Object Lock works only in versioned buckets. Learn more
Object Lock
Disabled
This bucket doesn't have Object Lock enabled. You can enable Object Lock for a versioned bucket under the bucket's properties tab. Learn more
