Phase 7 — Add-ons in 'cloudshield-s3-bucket', Systems Manager & Patch Manager

This phase adds operational protections to the project S3 bucket and documents Systems Manager access and Patch Manager scanning/output delivery.

CloudShield S3 bucket add-ons

- Keep Block Public Access enabled and review versioning, lifecycle settings, and the HTTPS-only bucket policy against the bucket's intended use.
- Use IAM identity policies and the S3 Gateway Endpoint policy together. The endpoint policy filters requests that use the endpoint; it does not replace IAM permissions or the bucket policy.

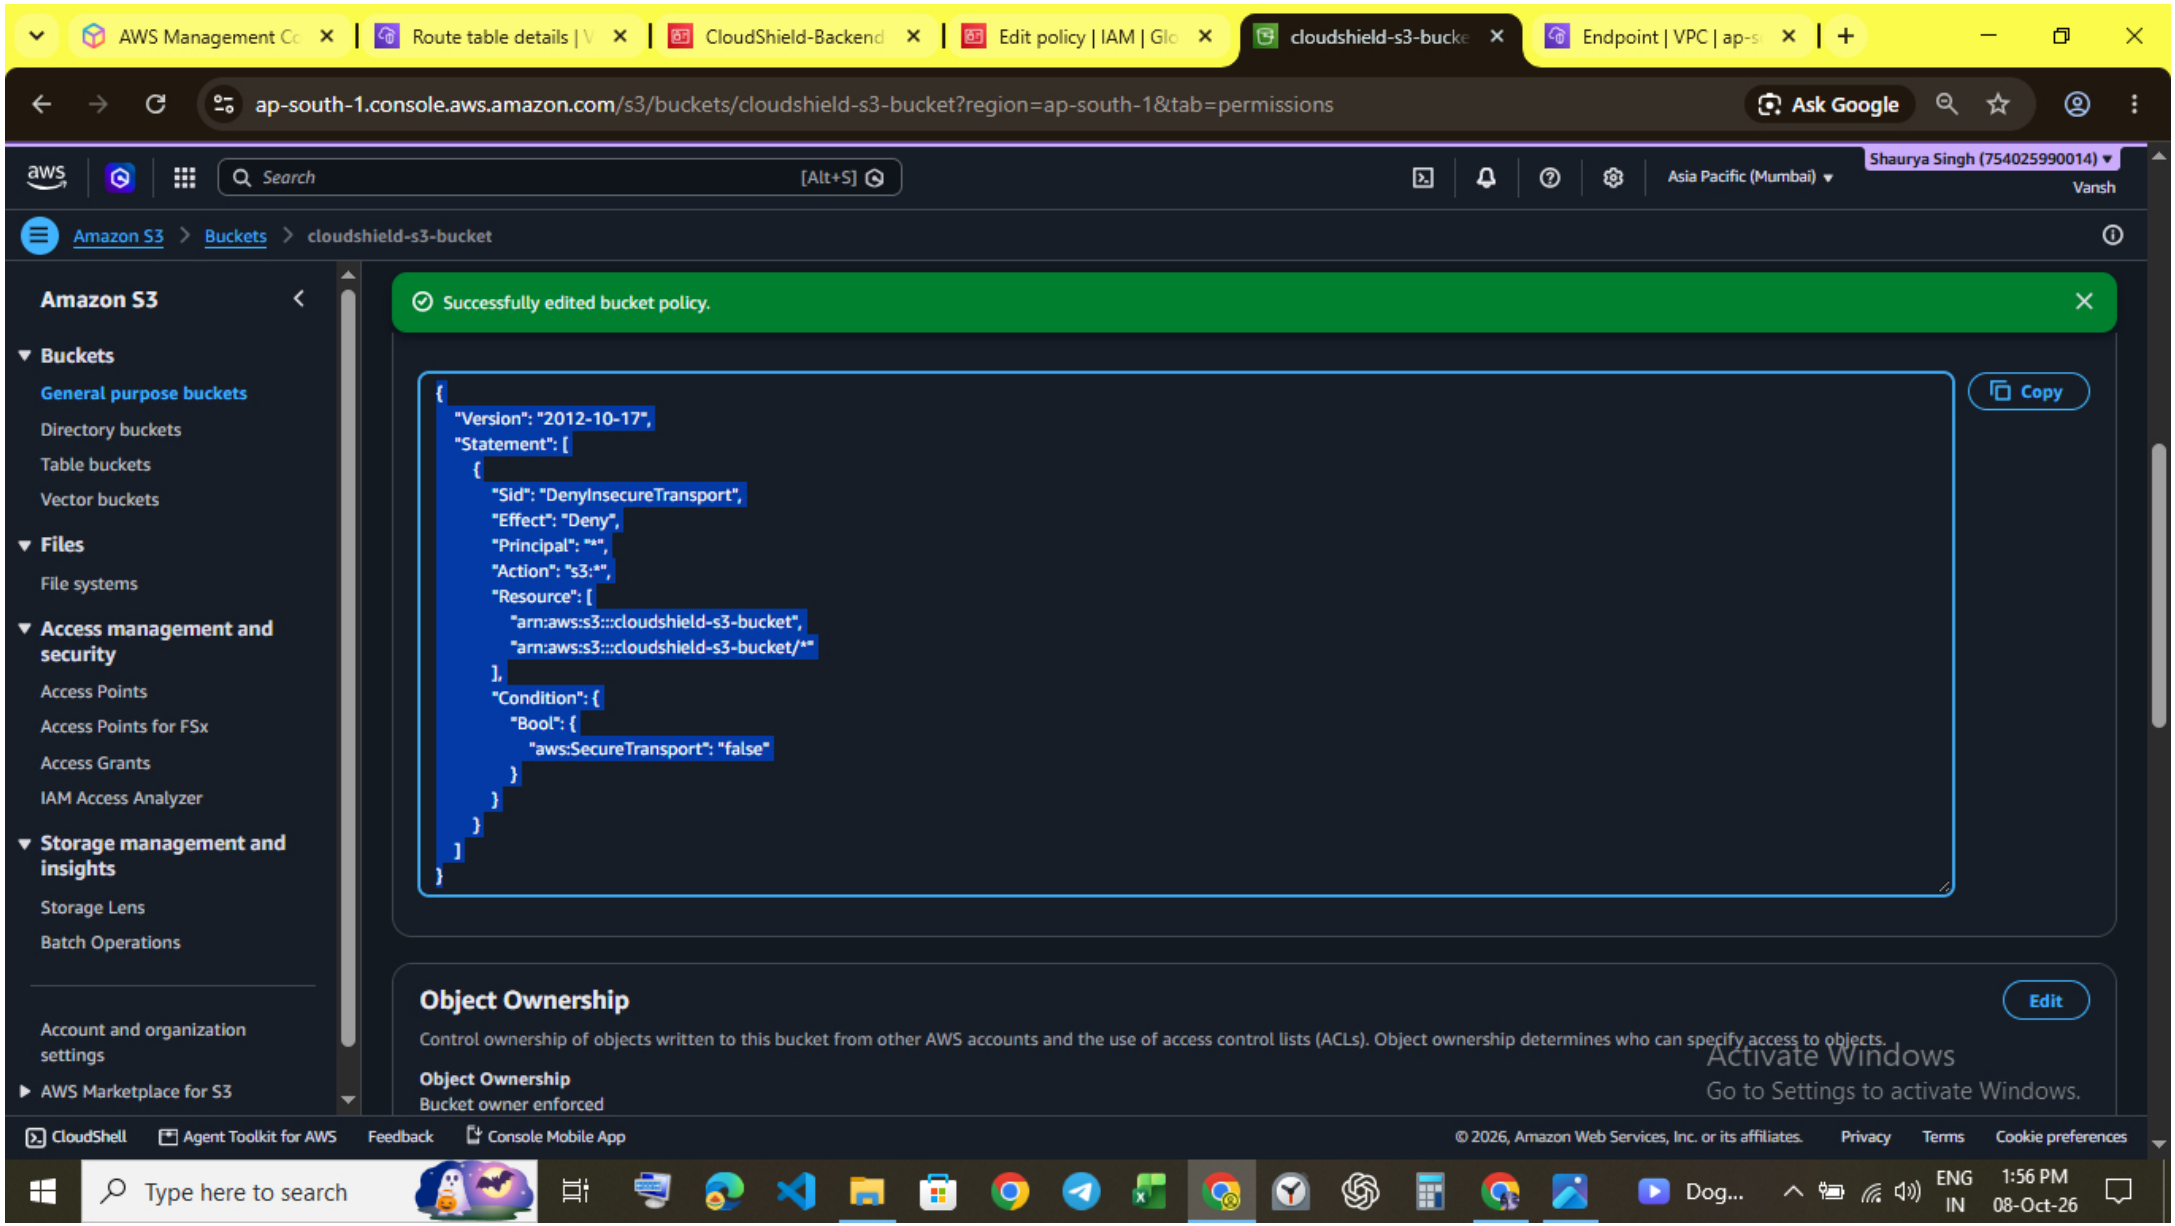

Systems Manager and Patch Manager

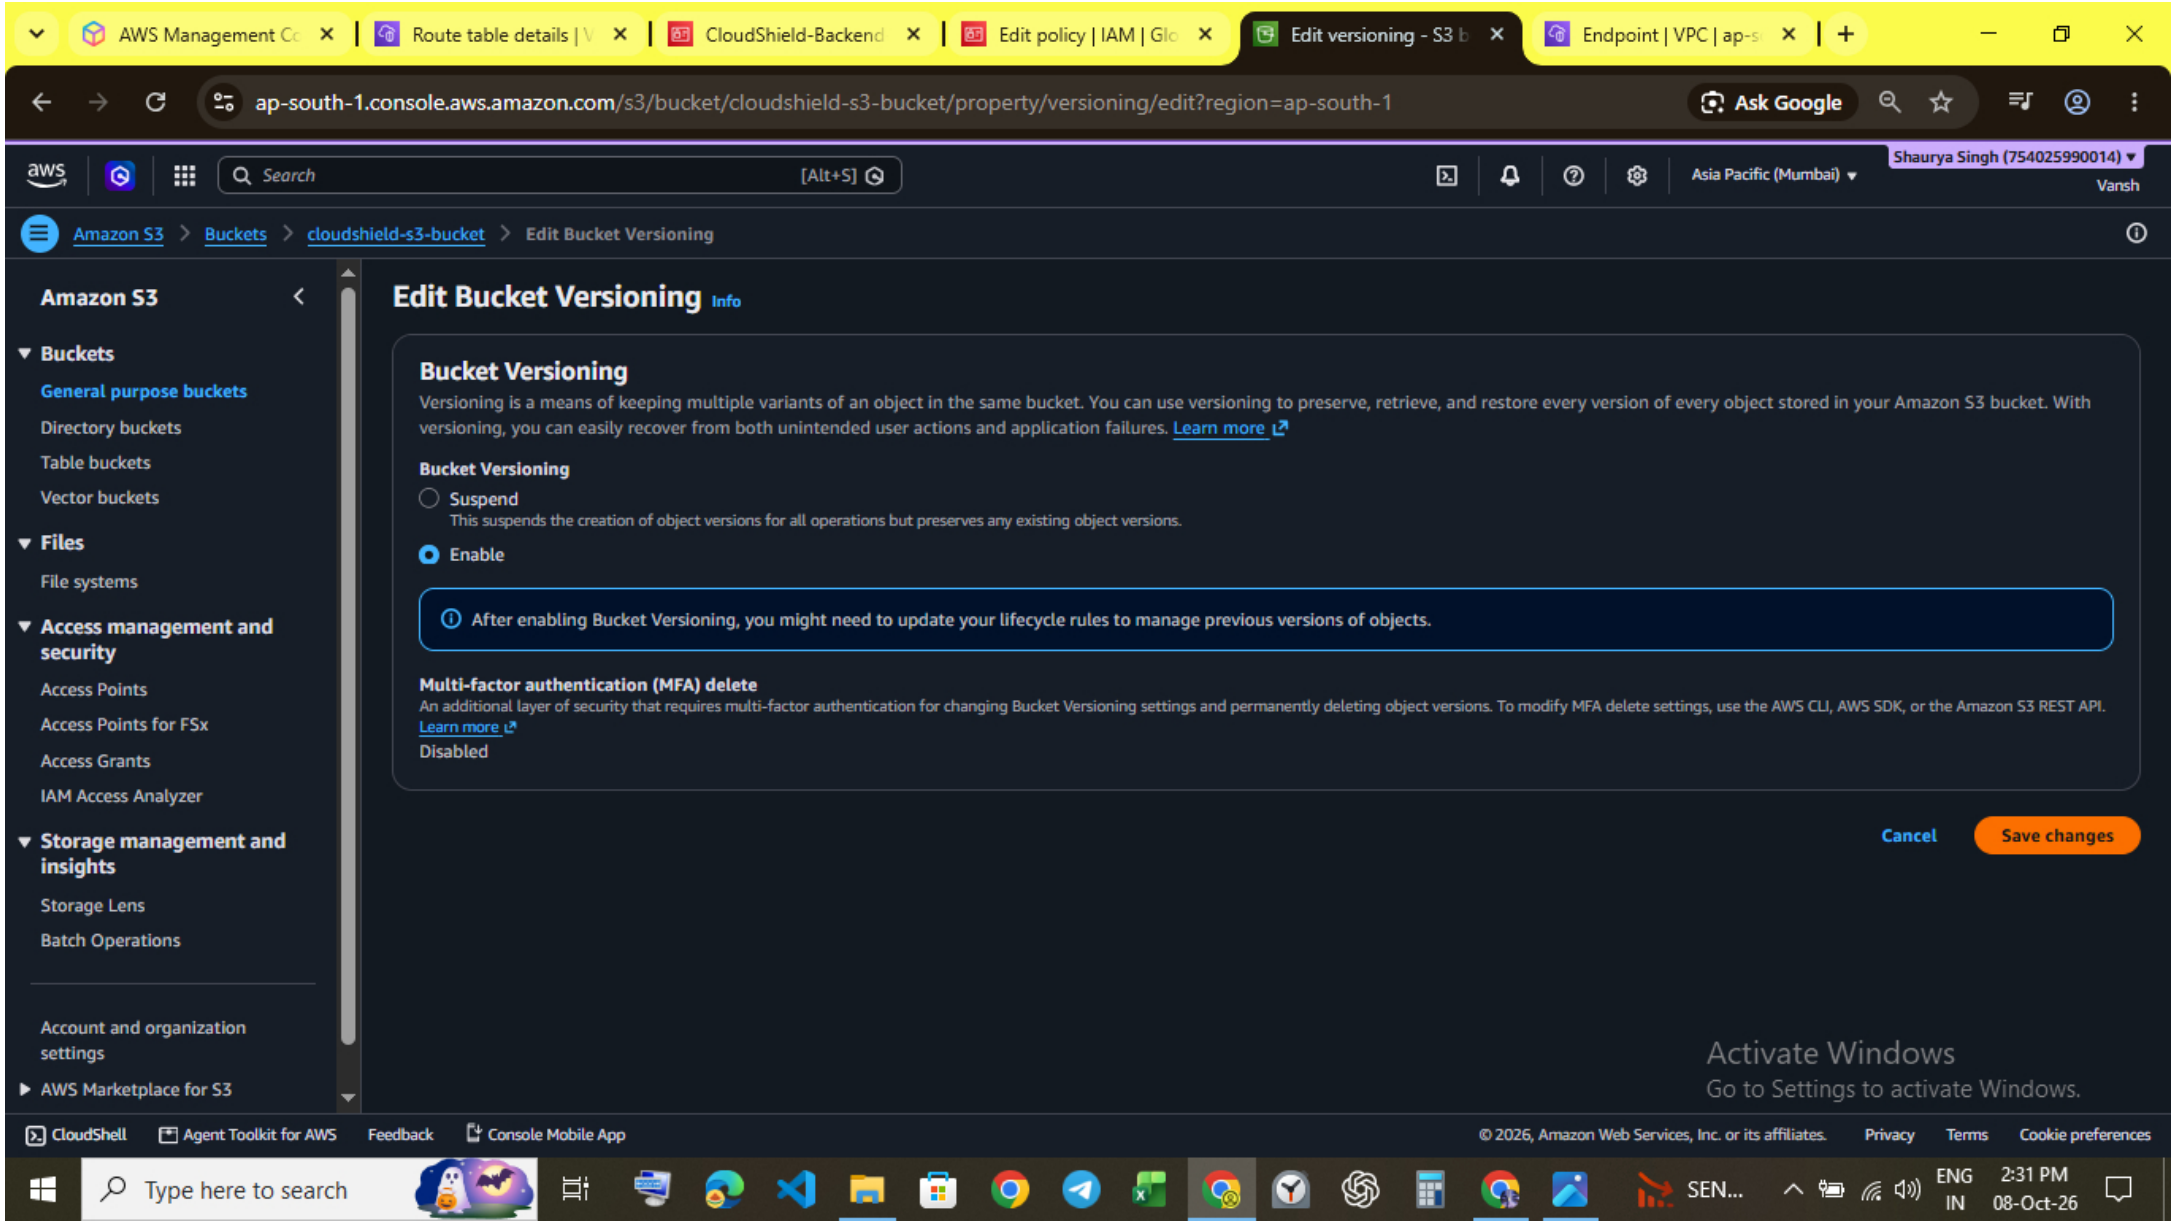

- Use Session Manager to administer managed EC2 instances without opening inbound SSH.
- The documented Patch Manager Quick Setup policy is configured for a daily Scan operation targeting the Linux EC2 instances. Scan assesses patch compliance; it does not install patches.
- Custom output destination: cloudshield-patch-manager-logs. Instance-role permissions and the endpoint policy must allow the required S3 object operations for requests routed through the endpoint.

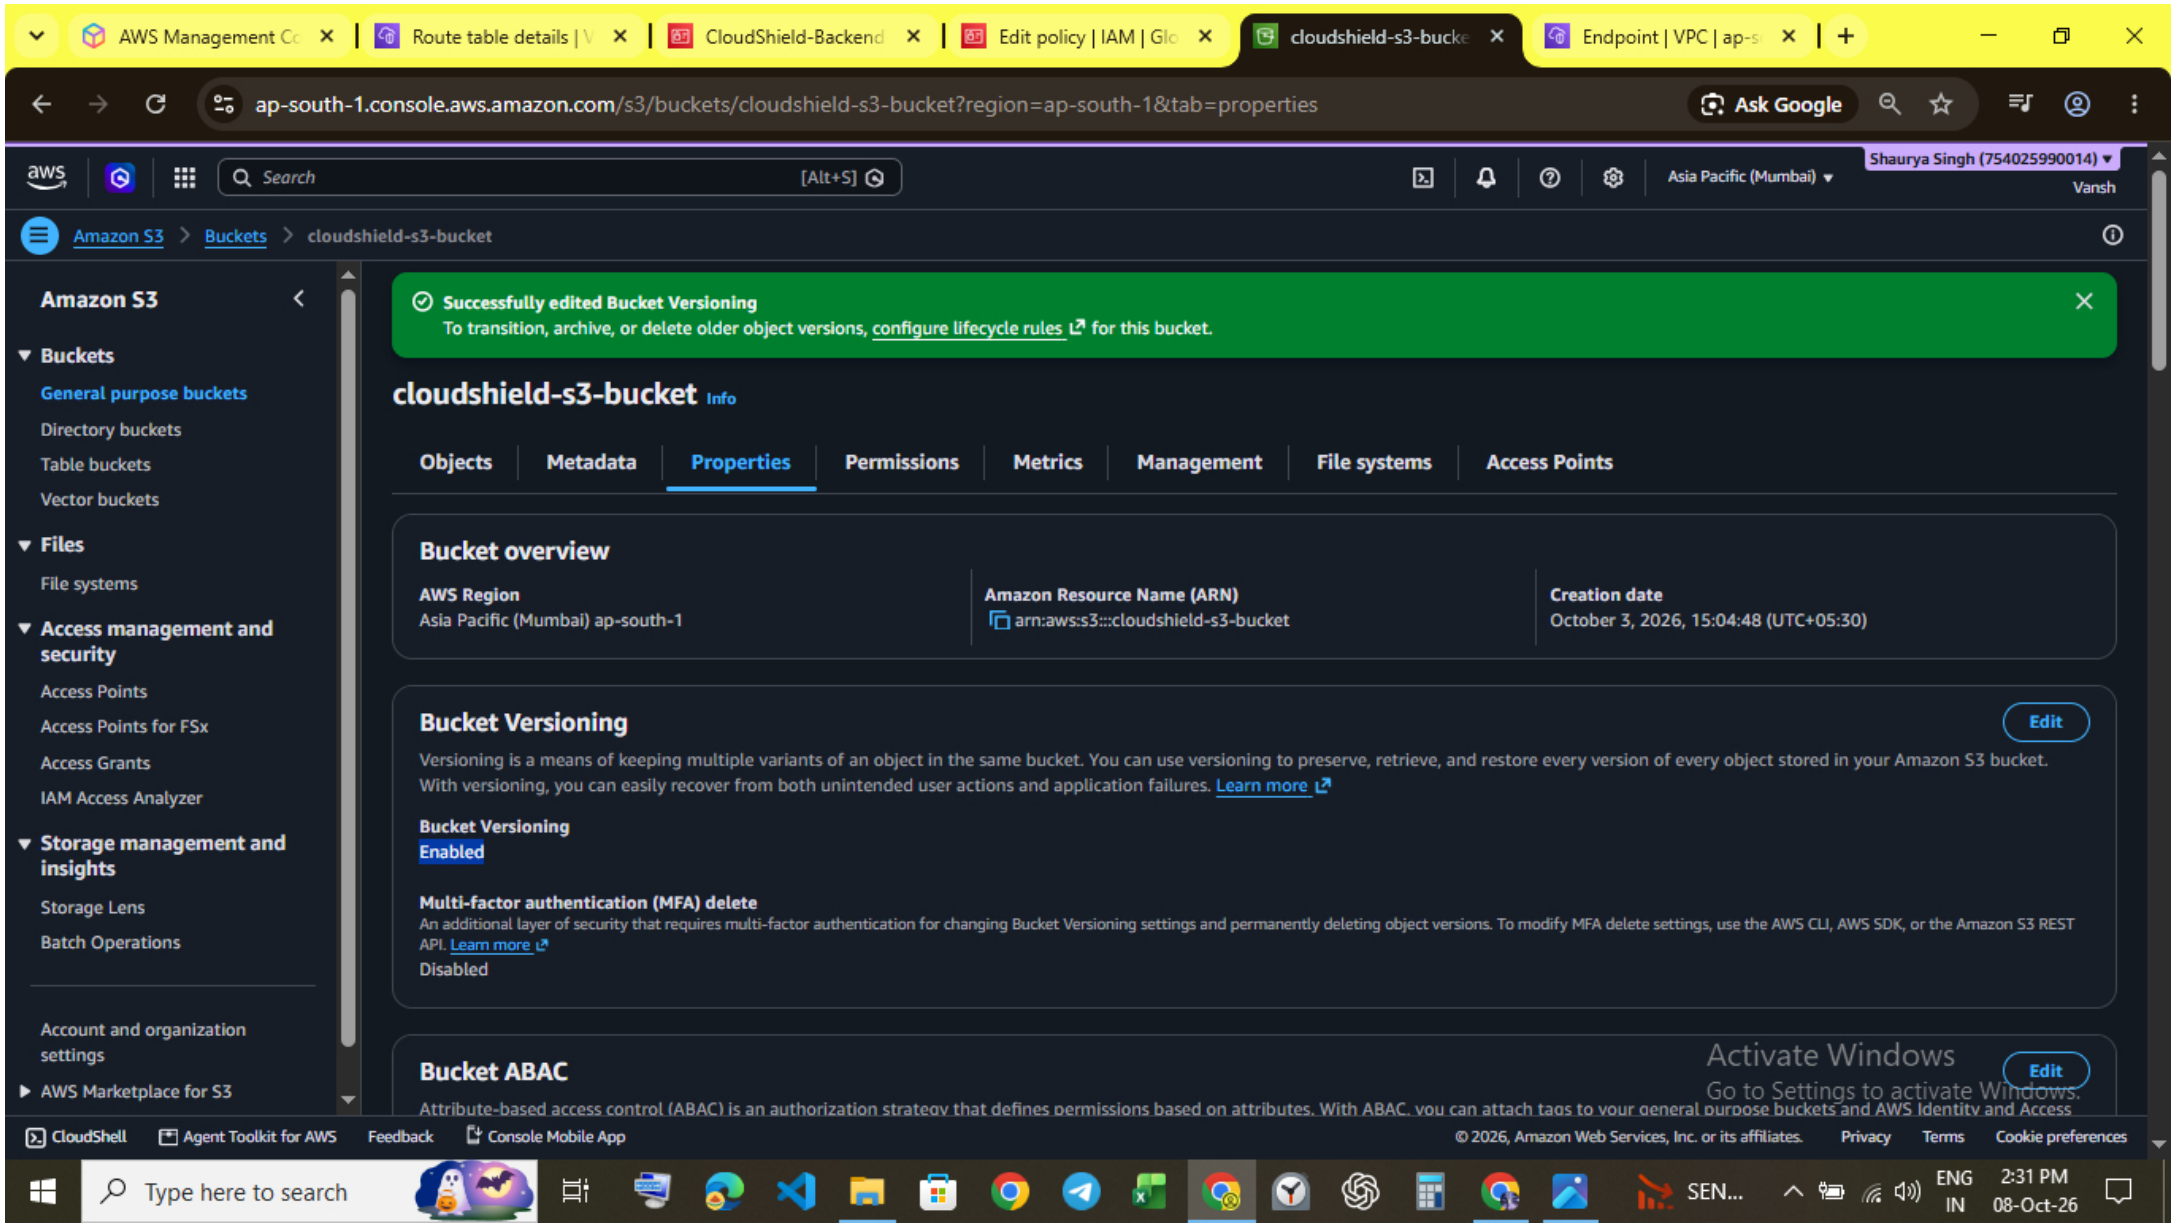

Validation points

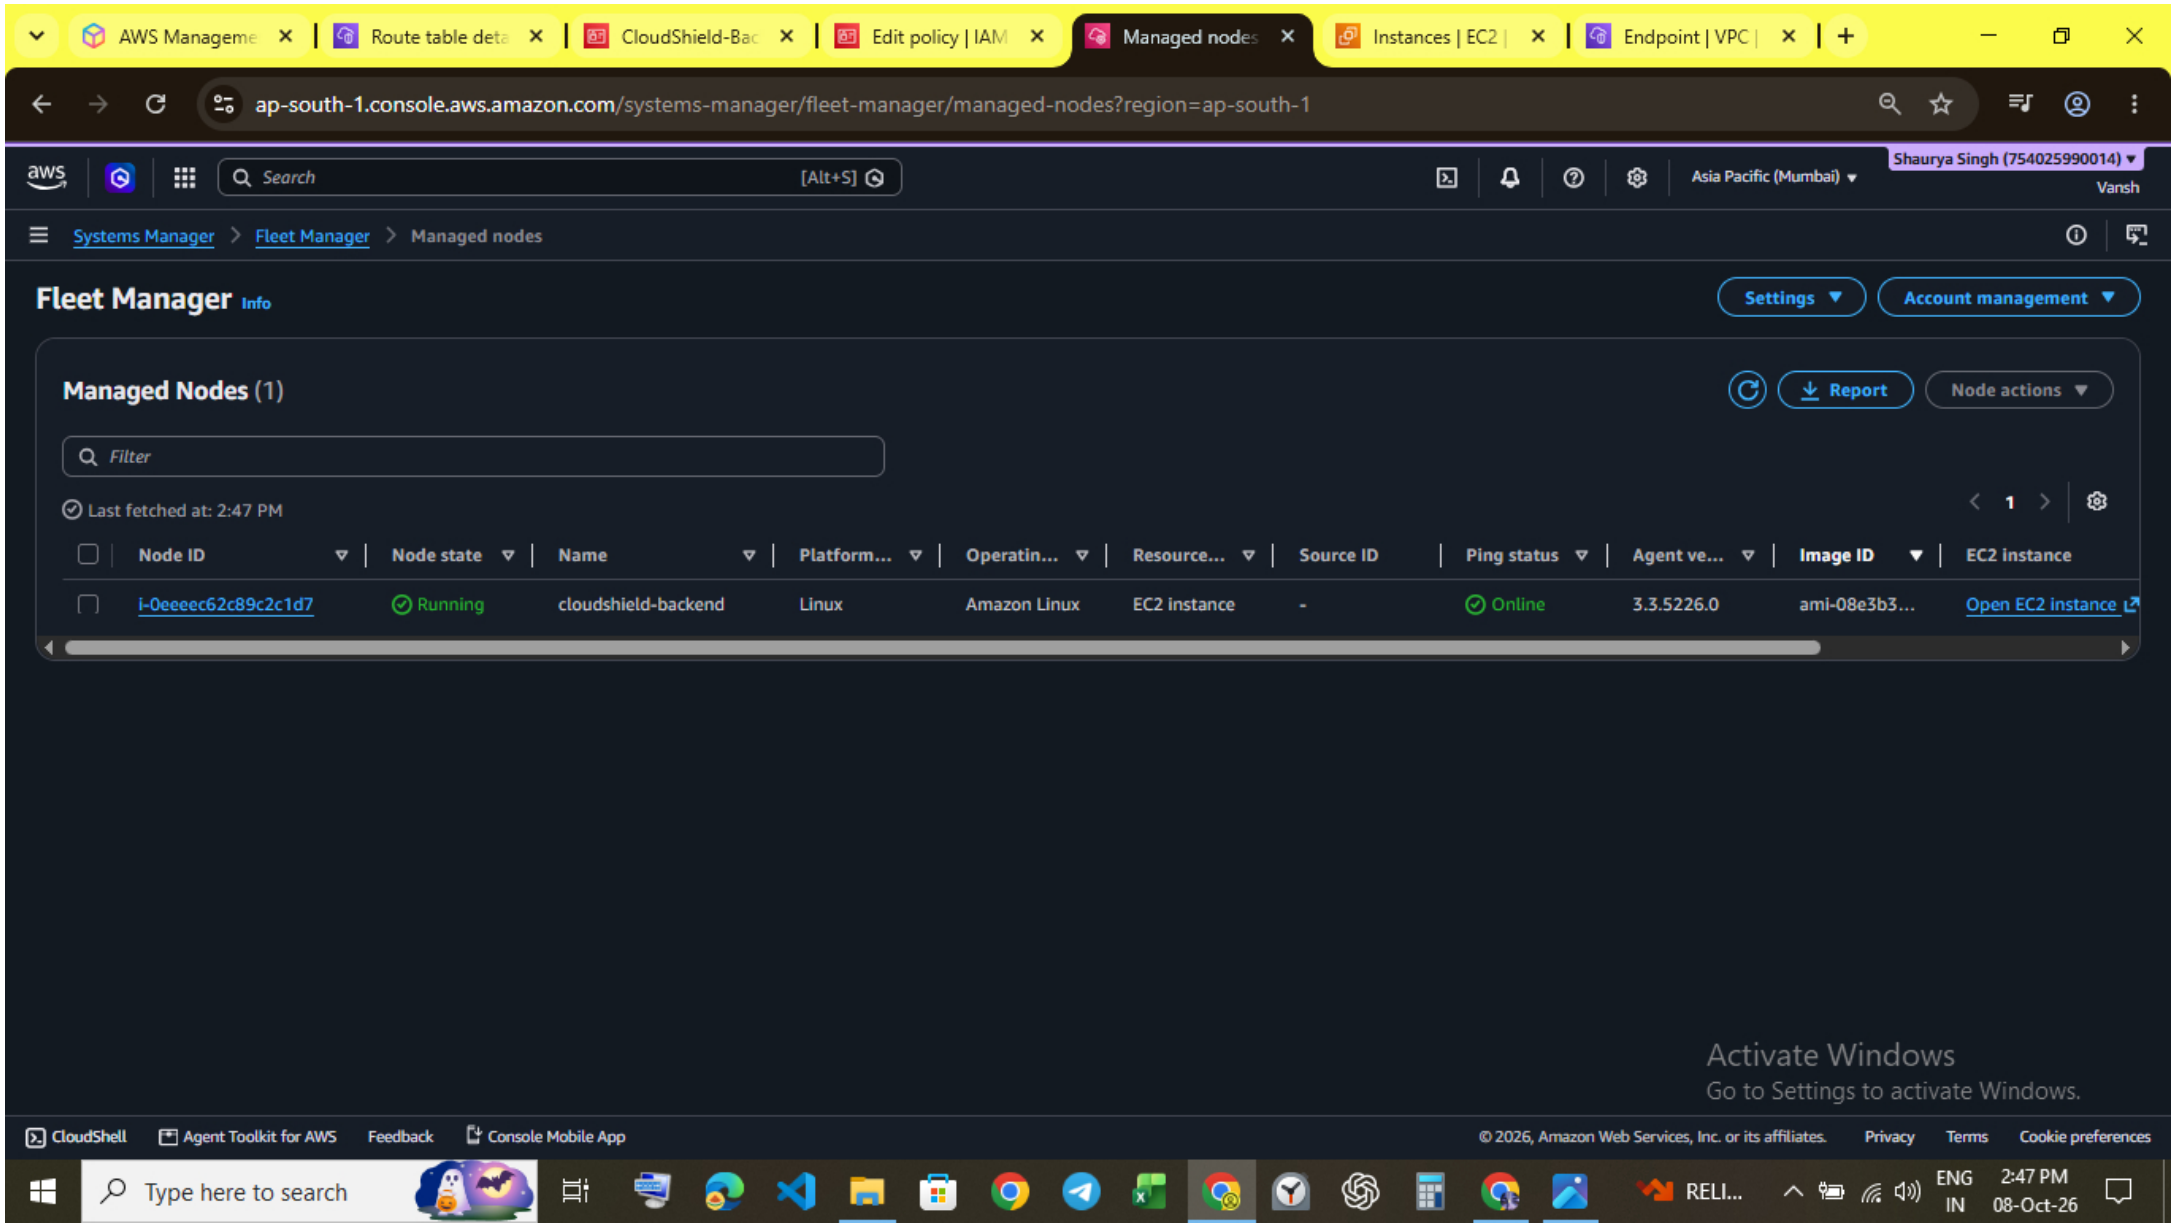

- Confirm managed-node status, role policies, Quick Setup configuration/tag, scan association status, and output objects in the destination bucket.

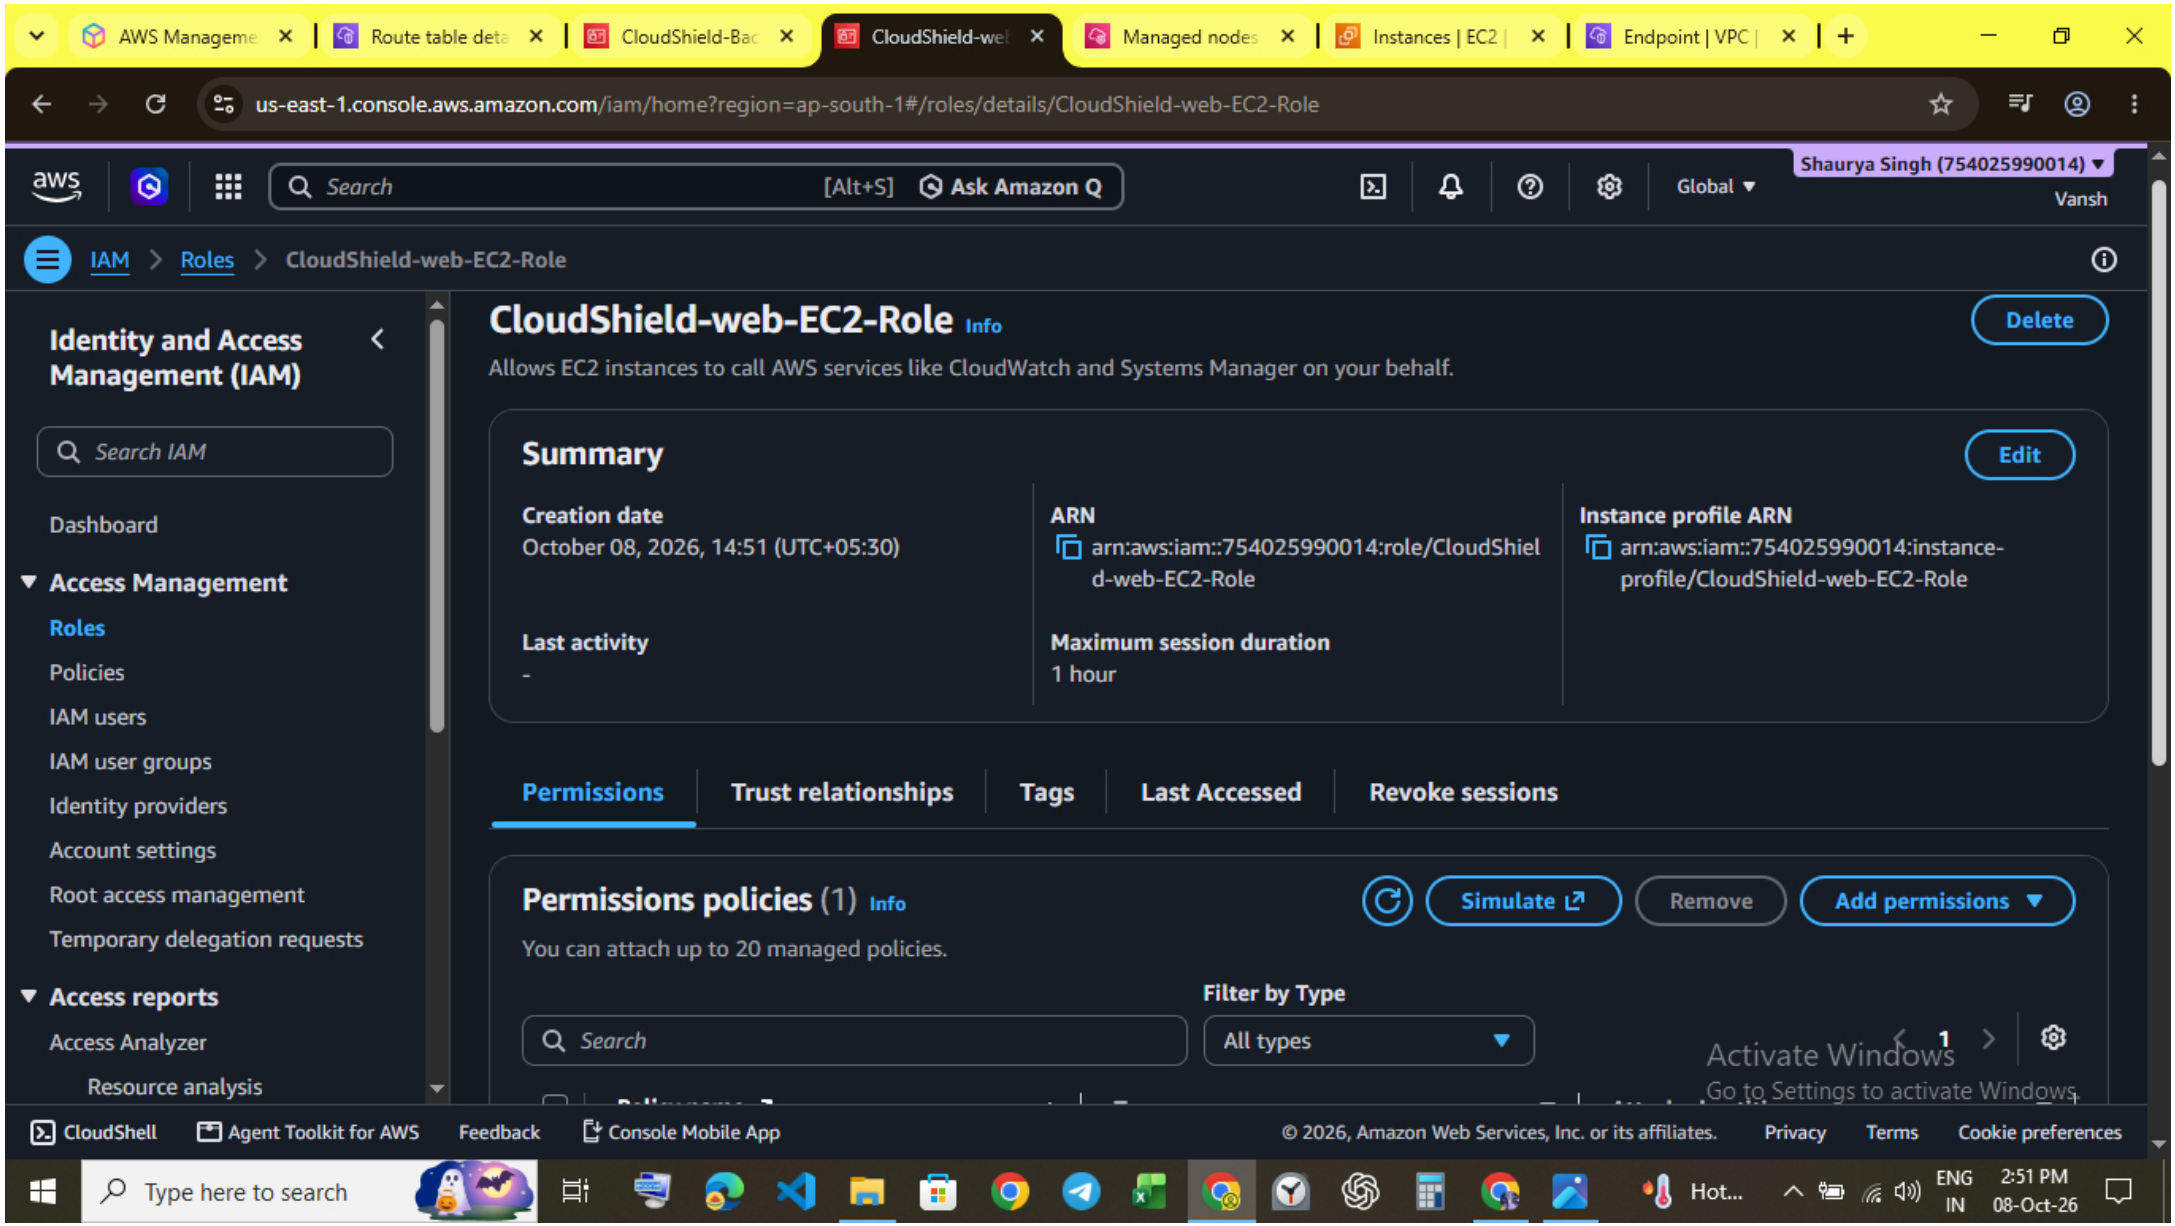

The dedicated Patch Manager troubleshooting section records the HTTP 403 baseline/payload issue and the S3 output-delivery fix. Preserve the distinction between configuration evidence and a successful live test.

Edit Bucket Versioning Info
Bucket Versioning
Versioning is a means of keeping multiple variants of an object in the same bucket. You can use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. With versioning, you can easily recover from both unintended user actions and application failures. Learn more
Bucket Versioning
Suspend
This suspends the creation of object versions for all operations but preserves any existing object versions.
Enable
After enabling Bucket Versioning, you might need to update your lifecycle rules to manage previous versions of objects.
Multi-factor authentication (MFA) delete
An additional layer of security that requires multi-factor authentication for changing Bucket Versioning settings and permanently deleting object versions. To modify MFA delete settings, use the AWS CLI, AWS SDK, or the Amazon S3 REST API.

Scanning schedule
Use recommended defaults
Patch Manager scans your nodes daily at 1:00 AM UTC.
Custom scan schedule
Create a custom scanning schedule.
Wait to scan targets until first CRON interval.
Patch baseline
Patch baselines include rules for auto-approving patches within days of their release, in addition to a list of approved and rejected patches. Learn more
Use recommended defaults
The default patch baseline defined for each operating system supported by AWS.
Custom patch baseline
Select a custom patch baseline. Custom patch baselines must be in the home AWS Region specified for Quick Setup and can be up to 3,336 bytes.
Patching log storage
Write output to S3 bucket
Store patching operation logs in an Amazon S3 bucket. Patching operation output in the console is truncated after 48,000 characters.
S3 URI
Select the S3 bucket for storing patching logs. Only buckets in the current Region can be selected.

Targets - optional
Choose the nodes that the patch policy is deployed to.
Choose between deploying to the current Region or a custom set of Regions. - optional
Current Region
Deploy configuration to the current Region.
Choose Regions
Choose the Regions you want to deploy this configuration to.
Target Nodes
Choose how you want to target instances
All managed nodes
Deploy the patch policy to all managed nodes in the current account.
Specify the resource group
Deploy the patch policy to the resource group in your current account.
Specify node tag
Specify a tag key-value pair to select nodes in your account.
Manual
Manually specify the instances you want to configure.
Rate control
Specify the concurrency rate and error rate to run your patch policy with.
Concurrency
Provide the number or percentage of nodes to run the patch policy on at the same time.
3
Number of nodes
The number of nodes must be between 1 and 9999999.
Activate Windows
Go to Settings to activate Windows.

3
Number of nodes
The number of nodes must be between 1 and 9999999.
Error threshold
Provide the number or percentage of nodes to permit errors on before the patch policy fails.
2
Number of nodes
The number of nodes must be between 0 and 9999999.
Instance profile options
Add required IAM policies to existing instance profiles attached to your instances.
Enabling this option changes default behavior
Quick Setup automatically creates AWS Identity and Access Management (IAM) policies and instance profiles with necessary permissions based on your configuration choices. Quick Setup attaches these instance profiles only to instances without existing profiles. When you enable this option, Quick Setup also adds two required IAM policies to instances that already have profiles: "AmazonSSMManagedInstanceCore" "aws-quicksetup-patchpolicy-baselineoverrides-s3" When you don't enable this option, Quick Setup won't modify instances with existing profiles. You must manually configure the required policies for these instances or your patching operations will fail.

Local deployment roles
Every QuickSetup Configuration manager which targets the current Account requires IAM roles that enable such deployments Learn more
Create and use new IAM local deployment roles
QuickSetup will create and use new AWS-QuickSetup-PatchPolicy-LocalAdministration and AWS-QuickSetup-PatchPolicy-LocalExecutionRole roles which attach the AWSQuickSetupPatchPolicyDeploymentRolePolicy managed policy.
Use existing IAM roles

Summary
Choose "Create" to create a patch policy with the following configuration:
Patch policy name: CloudShield-Patch-Policy
Scan for missing patches daily at 1:00 AM UTC
Update nodes based on default patch baselines
Store patch operation logs in s3://cloudshield-patch-manager-logs
Target: Current account
Regions: ap-south-1
Nodes: All managed nodes
The number or percentage of nodes to run the patch policy on at the same time: 3
The number or percentage of nodes to permit errors on before the patch policy fails: 2
